UL Electrical Lab Testing Temp

---

Dear Kitty Cheng,

Testing is an essential phase of production through the high-tech industry. Ensuring that customers receive reliable products is essential to building a company's reputation, and UL helps provide that to many industrial partners.

I am a graduate in Electronic Systems Engineering from Lancaster University in the UK. Since finishing my Masters degree in 2011, I have pursued a variety of work experience around the world. This has helped me to see the world from different perspectives, and consider the environmental impact of my purchase choices.

From the end of February 2014, I will be available to work for at least 6 months, and I am interested in returning to Taiwan. I spent 2 months working in Neihu in 2010 for Wildmind, a software company. That job included gathering data, and also some software testing. My impression of the country during my visit was very pleasing, and I would like to return for longer.

My attached CV outlines my internships, some of which may be helpful. I am open to receiving new training, and making a practical contribution to the needs of UL and your clients over the course of several months. I am a native English speaker, though I regret that my Mandarin is still very basic. If there is time available outside working hours, I would like to spend time improving my language skills.

Please contact me if you would like talk more about the possibility of me working for UL!

Best regards,

Peter Burkimsher
